These adaptations of problems from real life should help you with the homework assignment you'll submit for grading and credit. You should save and print out the Table of Equivalents which you'll find necessary here, and useful throughout your future gardening, whether at home or professionally.

A couple other hints to make life easier: break the work into parts, and use ratios. For example with parts, if asked to convert mg/l to oz/gal, first covert the mg to oz, and then the L to gal. For ratios, set up the problem such as 1/3=?/6, then cross multiply so 6=3x, then divide each side by 3 giving 2=x.

---

1. The edge of a circular flower bed, 220 ft in diameter, needs mulch. How many cubic yards (yd$^3$) of mulch do you need if you want the mulch to cover 3 ft in from the edge to a depth of 2.5 inches, all the way around?

Diameter = 220 ft
radius = 110 ft.
pi = 3.142
Area of a circle = pi x r$^2$

Area of total bed = 3.142 x (110)$^2$ = 38018.2 ft$^2$
Area of inside bed = 3.142 x (110-3)$^2$ = 35972.8 ft$^2$
Area of ring needing mulch = 38018.2 - 35972.8 = 2045.4 ft$^2$

Volume of ring (2.5 inches deep = 0.208 ft) = 2045.4 x 0.208 = 425.4 ft$^3$
Convert cubic feet to cubic yards $\Rightarrow$ 1 yd$^3$ = 27 ft$^3$ so 1 ft$^3$ = 0.037 yd$^3$
425.4 x 0.037 = 15.7 yd$^3$ = 16 yd$^3$

OR

1 yd$^3$ = 325 ft$^2$ to 1" deep

\[
\frac{325 \text{ ft}^2}{1 \text{ yd}^3} = \frac{2045 \text{ ft}^2}{x}
\]

325x = 2045 x = 6.29 6.29 x 2.5" = 15.75 yd$^3$ = 16 yd$^3$

2. You are going to plant a kidney shaped bed with annuals, with each plant 1 ft from the next. The bed width measurements, which were taken every 10 feet, are 11 ft, 13 ft, 5 ft, and 17 ft. Approximately how many annuals will you need to fill the bed?
Area = (add the widths) multiply times feet between each width measurement (you're basically adding up several rectangles, granted the bed edges curve, but the extra plants make up for those on the ends)

Area = (17 + 5 + 13 + 11) x 10 = 460 ft which at 1 ft apart (one sq ft per plant) means 460 annuals

3. How many bags of potting soil would you need to fill 5 very large planters that take 1.75 bushels of potting medium each? Each bag of potting medium is about 3 cubic feet.

1.75 bushels x 5 planters = 8.75 bushels needed

\[
\frac{1 \text{ bushel}}{1.25 \text{ ft}^3} = \frac{8.75 \text{ bushels}}{x}
\]

\[x = 11 \text{ ft}^3\]

\[\frac{11 \text{ ft}^3}{3 \text{ ft}^3} = 4 \text{ bags}\]

4. You read a fertilizer recommendation for flower gardens and want to try it in your own. Your garden area is 1545 square feet and the recommendation is for 2050 pounds per hectare. How much fertilizer will you need?

To convert square ft to acres \(\rightarrow\) multiply by \(2.296 \times 10^{-5}\)

\[1545 \text{ ft}^2 \times (2.296 \times 10^{-5}) = 0.035 \text{ acres}\]

To convert acres to hectares

\[
\frac{1 \text{ acre}}{0.4047 \text{ ha}} = \frac{0.035}{x}
\]

\[x = 0.014 \text{ ha}\]

\[
\frac{2050 \text{ lbs}}{1 \text{ ha}} = \frac{x}{0.014 \text{ ha}}
\]

\[x = 28.7 \text{ lbs} (= 29 \text{ lbs})\]

5. How much of ProGro, a 5-3-4 organic fertilizer, do you need to get the same amount of phosphorus \((P_2O_5)\) as if you were using 15 pounds of a 15-10-10 chemical fertilizer?

5-3-4 fertilizer = 3% \(P_2O_5\)

15-10-10 fertilizer = 10% \(P_2O_5\) \(\rightarrow\) 15 lbs x 10% = 1.5 lbs of \(P_2O_5\)

3% times \(x\) lbs in 5-3-4 = 1.5 lbs \(P_2O_5\) in 15-10-10

\[x = 50 \text{ lbs} \ P_2O_5\]
6. A gardener applies a dry 20-10-20 fertilizer to her flower beds, using 2 pounds of potassium (K₂O) per 1000 square feet, 2 times a year. If a 50 lb bag of this fertilizer costs $9.50, how much is this gardener paying a year for this application?

\[20\text{-}10\text{-}20 \text{ fert.} = 20\% \text{ K}_2\text{O} \rightarrow 20\% \times x = 2 \text{ lbs} \quad x = 10 \text{ lbs 20-10-20 times twice a year} = 20 \text{ lbs} 20-10-20\]

\[
\begin{align*}
50 \times 9.50 &= 20x \\
9.50 \times x &= 190 \\
\therefore x &= $3.80
\end{align*}
\]

7. You only have access to measuring devices that are in mL and liters but you know you need 4 teaspoons per gallon of a liquid fertilizer. How many mL per liter is that?

\[
\begin{align*}
1 \text{ L} &= 0.264 \text{ gal} \\
1 \text{ tsp} &= 5 \text{ mL} \rightarrow 4 \text{ tsp} = 20 \text{ mL}
\end{align*}
\]

\[
\begin{align*}
x \text{ mL} &= \frac{20 \text{ mL}}{0.264 \text{ gal}} \times 1 \text{ gal} \\
x &= 20 \times 0.264 = 5.28 \text{ mL/L}
\end{align*}
\]

8. Your dry fertilizer recommendation calls for 7 ounces per gallon, or how many grams per liter is that?

\[
\begin{align*}
1 \text{ oz} &= 28.35 \text{ g} \rightarrow 7 \text{ oz} &= 198.45 \text{ g} \\
1 \text{ L} &= 0.264 \text{ gal}
\end{align*}
\]

\[
\begin{align*}
\frac{198.45 \text{ g}}{1 \text{ gal}} &= \frac{x \text{ g}}{0.264 \text{ gal}} \\
x &= 198.45 \times \frac{0.264}{0.264} = 52.39 \text{ g/L}
\end{align*}
\]

9. Your recipe for potting mix calls for 4 pounds per cubic yard of one of the fertilizer ingredients. You are only making 4 1/2 cubic feet. How many grams of this ingredient do you need to add?

\[
\begin{align*}
1 \text{ lb} &= 453.6 \text{ g} \rightarrow 4 \text{ lbs} &= 1814.4 \text{ g} \quad 1 \text{ ft}^3 = 0.037 \text{ yd}^3 \rightarrow 4.5 \text{ ft}^3 &= 0.1665 \text{ yd}^3 \\
\frac{1814.4 \text{ g}}{1 \text{ yd}^3} &= \frac{x \text{ g}}{0.1665 \text{ yd}^3} \\
x &= 302.09 \text{ g} / 4.5 \text{ ft}^3
\end{align*}
\]

\[
\begin{align*}
\text{OR} \quad \frac{1814.4 \text{ g}}{1 \text{ yd}^3} &= \frac{x \text{ g}}{0.037} \\
x &= 67 \rightarrow 67 \times 4.5 = 301.5 \text{ g} / 4.5 \text{ ft}^3
\end{align*}
\]

10. You have a pesticide sprayer that holds 70 quarts but your directions for a botanical pesticide are to mix it at a rate of 8 fluid ounces per 100 gallons. How much do you need to mix for your sprayer?

\[
\begin{align*}
\frac{1 \text{ gal}}{4 \text{ qt.}} &= \frac{x \text{ gal}}{70 \text{ qt.}} \\
4x &= 70 \\
x &= 17.5 \text{ gal}
\end{align*}
\]
11. You see a recommendation for a horticultural oil spray for mildew of 12ml/L. How many Tablespoons (Tbsp)/gallon is this? 3.785L in gal

\[
\frac{12\text{ml}}{1\text{L}} = \frac{x\text{ml}}{3.785\text{L}}
\]

\[x = 45\text{ml/gal}\]

\[
\frac{5\text{ml}}{1\text{tsp}} = \frac{45\text{ml}}{x\text{tsp}}
\]

\[x = 9\text{tsp/gal} = 3\text{Tbsp/gal} \quad (3\text{tsp} = 1\text{Tbsp})\]

12. You begin work in a greenhouse and are asked to make up a 100ppm (part per million) nitrogen (N) solution of fertilizer using 20-10-20. How many ounces of fertilizer will you add for 100 gallons to get the 100ppm N?

1ppm = 1 mg/L so 100ppm = 100mg of N needed/L but the fertilizer is 20% N, so

\[
\frac{100\text{mg fert}}{20\text{mg N}} = \frac{x\text{mg fert}}{100\text{mg N}}
\]

\[x = 500\text{mg fertilizer needed/L}\]

\[
\frac{500\text{mg}}{1\text{L}} = \frac{x\text{mg}}{3.785\text{L (gal)}}
\]

\[x = 1892.5\text{mg} = 1.89\text{g/gal} \quad \text{times 100 gal} = 189\text{g/100gal}\]

\[
\frac{28.35\text{g}}{1\text{oz}} = \frac{189\text{g}}{x\text{oz}}
\]

\[x = 6.7\text{oz/100 gal}\]

13. How much actual P is in a 80lb bag of 15-30-15 fertilizer?

as you probably know, the numbers stand for %N-%P₂O₅-%K₂O, so you have to convert to actual P and K

\[
\frac{100\text{lbs fert}}{30\text{ lbs P₂O₅}} = \frac{80\text{lbs fert}}{x\text{ lbs P₂O₅}}
\]

\[x = 24\text{lbs P₂O₅} \text{ or alternately 30\% times 80} = 24\]

from Equivalents table you see that P x 2.3 = P₂O₅ so P₂O₅ divided by 2.3 = P, or 24/2.3 = 10.4 lbs P in the 80 lb bag
